### Referenz

Earthquakes are tremendous and destructive natural disasters. Under all natural disasters earthquakes cause the biggest economic damages and demand most deaths worldwide. The science very exactly knows the extremely earthquake-threatened regions of this world and also knows around the danger potential. But till this day the science is not able to make an exact temporal prediction about the origin of an earthquake. Herein at last the great fear of people is founded to be unpreparedly surprised by such a disaster. Our village is located in the immediate sphere of influence of the earthquake region of Rantscha in Romania. In the past a lot of earthquakes occured in this region, which were also clearly to be felt in our village and which have frightened our inhabitants very much.

Therefore, in April 2013 in the center of our village, the Lyzeum building, an advanced earthquake early warning system was installed. The inhabitants were informed about the installation and it was explained to them how the system functions and how they have to behave in their immediate surroundings in case the advanced earthquake early warning system alarms. Now the advanced earthquake early warning system gives us the certainty that we will not surprised by the earthquake and that we will be warned in advance about the arrival of the earthquake. We are convinced that the rehearsed rules of conduct will help us to react fast and correct in order to increase the likelihood to survive the disaster unharmed.

Till this day the installed advanced earthquake early warning system has released no false alarm. In February, 2014 the company sectyelectronics GmbH has checked the earthquake system within the scope of the annual servicing. Defects were not ascertained.

We are very glad to have this earthquake system installed and we thank the developers for creating this advanced earthquake early warning system which in the future in case of a strong earthquake can helps us to preserve many people in our village from the death.
